執行./mp2.sh test *或是在container裡make qemu後出現下列compilation error:

```
kernel/defs.h:171:1: error: unknown type name 'pte_t'; did you mean 'pde_t'?
  171 | pte_t *         walk(pagetable_t, uint64, int);
      | ^~~~
      | pde_t
kernel/defs.h:171:34: error: expected ')' before 'uint64'
  171 | pte_t *         walk(pagetable_t, uint64, int);
      |                                  ^~~~~~~
      |                                  )
kernel/defs.h:172:38: error: expected ')' before 'uint64'
  172 | uint64          walkaddr(pagetable_t, uint64);
      |                                       ^~~~~~~
      |                                       )
kernel/defs.h:173:37: error: expected ')' before 'uint64'
  173 | int             copyout(pagetable_t, uint64, char *, uint64);
      |                                      ^~~~~~~
      |                                      )
kernel/defs.h:174:36: error: expected ')' before 'char'
  174 | int             copyin(pagetable_t, char *, uint64, uint64);
      |                                     ^~~~~
      |                                     )
kernel/defs.h:175:39: error: expected ')' before 'char'
  175 | int             copyinstr(pagetable_t, char *, uint64, uint64);
      |                                        ^~~~~
      |                                        )
cc1: all warnings being treated as errors
make: *** [<builtin>: kernel/slab.o] Error 1
student@65ad71f0139e:~/mp2$
```

但目前改動的檔案只有slab.c, slab.h, file.c, sysfile.c, syscall.c, syscall.h

已經執行過./mp2.sh update

請問這該怎麼解決？

Tuesday

發現是include到不該include的檔案造成，已解決
