[MP2] print_kmem_cache 裡面的 as_ptr 的意思以及 mp2-0 與mp2-6 錯誤訊息解釋

藍楷竣 (LAN, KAI-CHUN)

All Sections

1. 我看不太懂甚麼是「將該物件解釋為指標後的值」，這是甚麼意思？

2. mp2-0: 我在執行 `slab_obj_printer( freelist);` 的時候他會報錯，有人知道這可能是因為甚麼原因嗎？

```
   Invalid xv6 state <panic: kerneltrap>, remained debug message to parse: [SlabPrintfKmemStatusData(addr=2281017344, origin='kmem_cache { name: file, object_size: 504, at: 0x0000000087f59000, in_cache_obj: 0 }', name='file', object_size=504, in_cache_obj=0), SlabPrintfSlabListStatusData(origin='[ partial slabs ]', slab_type='partial'), SlabPrintfSlabStatusData(addr=2280972288, origin='[ slab 0x0000000087f4e000 ] { freelist: 0x0000000087f4e210, nxt: 0x0000000000000000 }', freelist=2280972816, nxt=0)]
   QEMU output saved to out/public/mp2-0.out.failed
```

3. mp2-6: 我在執行mp2-6的時候會出現這樣的錯誤訊息，有人知道這是甚麼意思嗎？甚麼是key error?

```
== Test public/mp2-6 (3%) ==
Traceback (most recent call last):
